

I created a folder named intro cv where you can find the final.ipynb file and results folder which is my code file and results of 5 different sets of images results which I got from that code.

### **Instructions how to run that code**

First upload the .ipynb file in google colab and as so upload the images to files and define the path for that images in the code where required and run the code then the code will excite successfully, sometimes it might take some time to execute but it will run successfully.

I executed code for 5 different sets of images and saved them in the results folder as 1,2,3,4,5 sets.
